### Operating modes:

#### THREE PHASE MODE

The three APS amplifiers are used for generating a three phase network system, either as a star connection with neutral or as a delta connection without neutral.

#### SINGLE PHASE PARALLEL MODE

The three amplifiers are set to parallel mode – thus having three times higher output power and output current capability with the option parallel connection an easy change between three phase and parallel mode is possible. Additionally the paralleled system has a common output panel with higher power capability in parallel mode.

#### SERIAL MODE

Two of the amplifiers are set in serial connection. This enables the system to double the output voltage capability and keep the nominal output power and peak current capability.

#### ANTI-SERIAL MODE

Two of the amplifiers are set to anti-serial connection. This operating mode is used for generating high DC voltages with positive and negative voltages. One APS is the positive side, the second one is the negative side.
